Section I

GENERAL

1. Scope.—a. General.—This manual is published for the information and guidance of ordnance maintenance personnel, and is the first of several maintenance manuals on these vehicles. It contains detailed instructions for inspection, disassembly, assembly, maintenance, and repair of the power train (axles, propeller shafts, transfer case, transmission) for scout car M3A1 supplementary to those in the Field Manuals and Technicals Manuals prepared for the using arms.

Additional descriptive matter and illustrations are included to aid in providing a complete working knowledge of the matériel.

b. Vehicle generally.—Information is also included concerning the

service maintenance, technical inspection, and lubrication of the entire vehicle.

 c. Chassis and body.—For maintenance information concerning the chassis and body components, see TM 9-1709.

1-4

ORDNANCE MAINTENANCE

d. Power plant.—For maintenance information concerning the engine and its accessories, see TM 9-1706 for the Hercules gasoline engine, model JXD; TM 9-1707, for the Hercules Diesel engine, model DJXD; and TM 9-1708, for the Buda Diesel engine, model 6DT317.

Section II

SERVICE MAINTENANCE

Pa	tragrapi
Objective	2
Scope	8
Allocation of repair jobs	4

- 2. Objective.—There is a distinct difference between the missions of organizational maintenance and those of service maintenance. Organizational maintenance by the using arms has for its prime objective the routine preventive maintenance, care, and adjustment of vehicles so they will be in good operating condition at all times with a minimum loss of time for repairs. Service maintenance by light and heavy maintenance organizations of the Quartermaster Corps and Ordnance Department has for its prime objectives supply, technical inspection, corrective action, and repair beyond the capacity of the using arms. This repair is accomplished by unit replacement, overhauling, rebuilding, reclaiming, manufacturing, or any other methods considered suitable.
- 3. Scope.—The scope of maintenance and repair by maintenance personnel is determined by the ease with which the project can be accomplished, the amount of time available, weather conditions, concealment, shelter, proximity to hostile fire, equipment, tools and parts available, and skill of the personnel. As all of these factors are variable, no exact system or procedure can be prescribed or followed.
- 4. Allocation of repair jobs.—The following operations augment those which may be performed by the using arms:
- a. Front and rear axles.—(1) Alinement.—Check and adjust for camber and caster.
 - Axle assembly.—Replace, repair, or rebuild.
 - (3) Axle housings.—Repair, weld, machine, and aline.
 - (4) Gear and pinions.—Adjust or replace.
 - Steering knuckles.—Replace or rebush.
 - (6) Wheel turning stop.—Adjust.
 - Body.—See TM 9-1709.
 - c. Brakes.—See TM 9-1709.
 - Cooling system.—See TM 9-1706, 9-1707, or 9-1708.

TM 9-1705 4-7

POWER TRAIN FOR SCOUT CAR M3A1

- Electric generating and starting system.—See TM 9-1707 or 9-1708.
 - f. Electric ignition system.—See TM 9-1706, 9-1707, or 9-1708
 - g. Electric lighting system and accessories.—See TM 9-1709.
 - h. Engine.—See TM 9-1706, 9-1707, or 9-1708.
 - Frame.—See TM 9-1709.
 - Fuel system.—See TM 9-1706, 9-1707, 9-1708, or 9-1709.
 - k. Instruments.—See TM 9–1709.
 - l. Propeller shafts.-Repair or rebuild.
 - m. Springs and shock absorbers.—See TM 9-1709.
 - n. Steering gear.—See TM 9-1709.
 - o. Transfer case components.—Replace, repair, or rebuild.
 - p. Transmission.—(1) Shift levers.—Repair.
 - Transmission components.—Replace, repair, or rebuild.
 - q. Wheels.—See TM 9–1709.

SECTION III

TECHNICAL INSPECTION

	aragraph
Description	5
Inspection form	6
Practical application	7

- 5. Description.—Technical inspections are a follow-up and check on organizational maintenance, inspection, and other maintenance functions. They determine whether the vehicle should be continued in service or withdrawn for overhaul. These inspections are covered in AR 850-15.
- 6. Inspection form (fig. 1).—W. D., Q. M. C. Form No. 260 (Technical Inspection Report of Motor Vehicles) is the standard and official form for recording the inspection of all motor vehicles, including combat vehicles of the Ordnance Department. The extent to which use is made of this form or its modifications depends entirely on the technical ability of available personnel, the time factor, and test and shop equipment available.
- 7. Practical application.—This paragraph contains inspection operations that pertain only to the power train.
- a. External inspection of body and frame components.—(1) Toein.—Check (see sec. V).
 - (2) Caster and camber.—Check (see sec. V).
- b. External inspection of chassis components.—(1) Front axle.— Inspect for straightness. Shake wheels to check for "wobble."

7

ORDNANCE MAINTENANCE

WAR DEPARTMENT QMC Form No. 300 App. Oct. 16, 1830

TECHNICAL INSPECTION REPORT OF MOTOR VEHICLES

This form indicates the scope of complete technical inspection of all motor vehicles for all echelons. It does not prescribe a required routine of procedure. Items will be checked to the extent of ability of personnel and adequacy of equipment available.

FIGURE 1.-Technical inspection form.

POWER TRAIN FOR SCOUT CAR M3A1

Inspect cross tube. Check for oil leaks and cracked housings. Test all nuts with wrench. Inspect brush guards and universal joint dust shields. Check presence of necessary plugs and lubrication fittings and evidence of proper lubrication. Inspect breather.

- (2) Wheels.—Check all wheel nuts with wrench. Check lubrication of bearings.
- (3) Transfer case.—Inspect for leaks and cracked case. Test all bolts with wrench. Check presence of necessary plugs and lubrication of fittings and evidence of proper lubrication. Inspect breather.
- (4) Transmission.—Inspect for leaks and cracked case. Test all bolts with wrench. Check presence of necessary plugs and lubrication of fittings and evidence of proper lubrication. Inspect breather.
- (5) Propeller shafts.—Inspect for distortion and fractures. Examine flanges. Test all nuts with wrench. Tighten dust caps. Check lubrication and relief valves.
- (6) Rear axle.—Check for oil leaks and cracked housings. Test all nuts with wrench. Check presence of necessary plugs and lubrication fittings and evidence of proper lubrication. Inspect breather.
- (7) Clutch.—Check for smoothness of operation. Test for effectiveness by setting drive shaft brake, or using the service brakes, putting the vehicle in low gear, and releasing the clutch pedal gradually: if the clutch is efficient, the engine should stall.
- (8) Gear box.—Listen to transmission and transfer case gears for a high-pitched whine or squeal which indicates internal misalinement or improper adjustment. In shifting gears, it is usual for the two lower speeds to be much noisier in operation than high gear. Unusual noises in the transmission when operating in the high gears should be investigated immediately to avoid severe damage.
- (9) Gear shift.—Check to see that the gear shift levers are fastened firmly in their retaining sockets and that the gear shift forks on the lower end of the levers move properly through all gear changes selected.

Section IV

LUBRICATION

Pa	ragrapi
General	8
Schedules	9
Methods	. 10
Engine lubrication system	11

8. General.—Lubrication is an essential part of preventive maintenance, determining to a great extent the serviceability of parts and

8-11

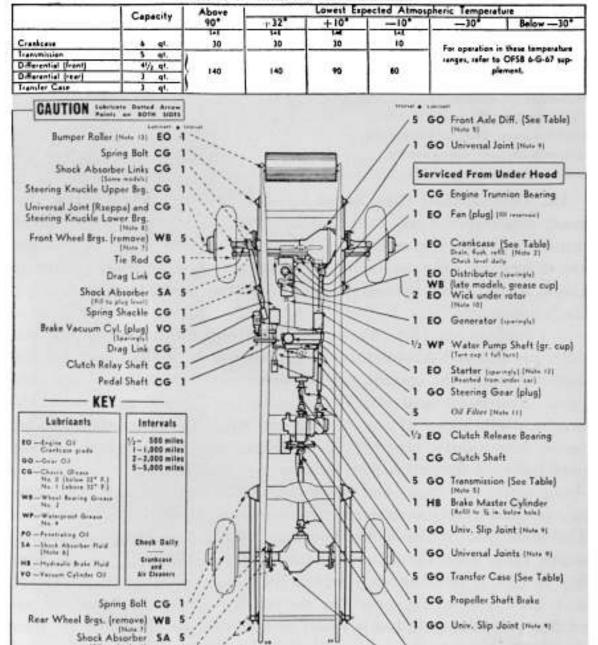

ORDNANCE MAINTENANCE

assemblies. Lubrication or the lack of it influences repairs and operations materially and is one of the most important factors affecting dependable service and useful vehicle life. Refer to OFSB 6-1 for a description of the ordnance lubrication program.

- 9. Schedules.—a. Records.—A complete record of lubrication will be kept for every vehicle. Responsible personnel will execute a check sheet at regular intervals to indicate the actual mileage and date at which each component receives such attention as prescribed (fig. 2).
- b. Supplies.—Lubricants and application equipment should conform to the recommendations of responsible manufacturers or the supply services concerned. Refer to OFSB 6-4 for the product guide. During field service, it may not be possible to supply a complete assortment of lubricants called for by the schedule to meet the recommendations, and it will be necessary to make the best use of those available, subject to inspection by the motor officer concerned in consultation with responsible ordnance personnel.
- Methods.—a. Application.—Refer to OFSB 6-2 for general lubricating instructions.
- b. Low temperature lubrication.—Refer to section III, OFSB 6-G-3, for information which supplements the lubrication guides in connection with chassis, crankcase, and gear lubricants utilized in temperatures below minus 10° F.
- c. Rubber parts.—Friction and vibration tend to develop squeaks, groans, and improper fitting of rubber chassis parts, instrument panel accessories, and engine mounts. Lubricants such as mineral oil, castor oil, engine oil, or other greases must not be used because they tend to swell or rot the rubber. A satisfactory lubricant can be made by mixing colloidal graphite with ethylene glycol or glycerine and adding enough water to prevent rapid drying before the solution has penetrated. The solution can be applied with an ordinary spray, but a needle spray will be needed to force the lubricant between parts having close clearance. Rubber parts which are used to keep other parts from slipping or rotating should not be lubricated.
- 11. Engine lubrication system.—See TM 9-1706, 9-1707, or 9-1708.

ORDNANCE MAINTENANCE

SECTION V

FRONT AXLE

Parag	Paragraph	
Description	12	
Trouble shooting	13	
Removal of assembly	14	
Disassembly of components	15	
Maintenance and adjustments	16	
Reassembly of components	17	
Installation of assembly	18	

- 12. Description (figs. 3 and 4).—The front axle is a spiral bevel gear, single-reduction, full floating type, with a straddle-mounted pinion gear and a conventional type differential. The front wheels are driven by axle shafts through Rzeppa type universal joints inclosed within specially designed steering knuckles at the outer ends of the housing.
- a. Construction (fig. 5).—(1) The front axle consists of steel tubes pressed and riveted into the gear housings at the inner ends and butt-welded to the sockets (or universal joint housings) at the outer ends. Hardened and ground kingpins are press-fitted and welded into opposite sides of the sockets and upon these are mounted opposed, heavy-duty, taper-roller bearings. These pivot bearings support the split-flanged socket housing and are adjustable by means of shims under the upper and lower bearing retaining caps. The upper cap and the drag link steering arm are integral on the left-hand side. The inner end of the socket housing incloses a steering-knuckle felt which rides upon the spherical wall of the socket. The socket housing carries a steering stop which limits the steering angle to 28°, and also a steering arm for tie rod attachment. The outer end of the socket housing has a wheel spindle or knuckle bolted to it and this fully incloses the constant-velocity, universal joint, drive shaft assemblies. A full floating hub is mounted upon the knuckle by means of tapered roller bearings so that the entire wheel end assembly carries the load independently of the shaft.
- (2) The hub is attached by means of studs to the drive flange which in turn engages with the universal drive shaft by means of a long spline. A cap screw, which passes through the center of the flange and screws into the end of the drive shaft, holds the Rzeppa joint in its correct running position. The Rzeppa joint is lubricated by fitting in this screw hole. Removal of this drive flange permits adjusting the inner and outer wheel bearings by means of two nuts secured with
